Module 18 Challenge **Due** Thursday by 11:59pm

Submitting a text entry box or a website url Points 100

Start Assignment

Background

program, so your first task on the job is to build a set of data reports to provide the answers. **Before You Begin** • Save this assignment to your Tableau Public account rather than GitHub.

• If you haven't already, make sure to create a Tableau Public <u>account</u> □. • The free tier of Tableau only lets you save to their public server. So, each time you save your file, it will be uploaded to your Tableau Public profile.

• When you finish your assignment, you will submit the URL to your Tableau Public workbook along with any additional files used in your analysis.

- You will be selecting files to download from the Citi Bike Data → source, as described in the following instructions.

 - Do not download every zip file available, as combining this much data will cause issues in Tableau. 1-3 zip files should be sufficient to meet the challenge requirements. Tableau restricts data file size to 1GB.

How many trips have been recorded in total during the chosen period? By what percentage has total ridership grown? How have the proportions of short-term customers and annual subscribers

> Today, what are the top 10 stations in the city for ending a journey? Based on data, why? Today, what are the bottom 10 stations in the city for starting a journey? Based on data, why?

on data, why do you hypothesize these are the top locations?

Today, what are the top 10 stations in the city for starting a journey? Based

- How does the average trip duration change by the type of user? (This may be under "User Type" or "member_casual" depending on the period the data
- timespan? How variable is the utilization by bike ID?

Which bikes (by ID) are most likely due for repair or inspection in the

- 3. Create one of the following visualizations for city officials: o Basic: A static map that plots all bike stations with a visual indication of the most popular locations to start and end a journey, with zip code data overlaid on top.
- The map you choose should also be accompanied by a write-up describing any trends that were noticed during your analysis. 4. Create your final presentation:

Create a Tableau story that brings together the visualizations, requested maps,

Ensure your presentation is professional, logical, and visually appealing.

• Advanced: A dynamic map that shows how each station's popularity changes

over time (by month and year). Again, with zip code data overlaid on the map.

- will be city officials, public administrators, and heads of New York City municipal departments. Your data and analysis need to be presented in a way that is focused, concise, easy to understand, and visually compelling. Your visualizations should be
- **Assessment** Your final product will be assessed on the following metrics: Analytic Rigor
 - technical skills and research abilities. Dig for an approach that works, and go with it. • Don't assume that the CSV format hasn't changed since 2013. Subtle changes to the formats in any of your columns can interfere with your analysis. Ensure that your

• You may need to get creative with how you combine each of the CSV files. Don't just

assume Tableau is the right tool for the job. At this point, you have a wealth of

data is consistent and clean throughout your analysis. (Hint: Start and End Time

• While utilizing all of the data may seem like a nice power play, consider the time course in making your analysis. Is data from 2013 the most relevant for making bike

- Remember, data alone doesn't answer anything. You will need to accompany your data visualizations with clear and directed answers and analysis. • As is often the case, your clients are asking for a LOT of answers. Be considerate about their "need to know" and the importance of not "cramming in everything." Of course, answer each question, but do so in a way that is organized and presentable.
- Look for obvious outliers or false data. Not everyone who signs up for the program is answering honestly. • In answering the question of "why" a phenomenon is occurring, consider adding other pieces of information, like socioeconomic or geographic data. Tableau has a map "layer" feature that you may find helpful.
- To share your work, save your workbook to Tableau Public and submit the URL so that your TAs can grade it. Save by using shortcuts (CTRL + S or CMD + S), or by clicking "File" then "Save to Tableau Public."

data on the program's utilization. Each month, bike data is collected, organized, and made public on the <u>Citi Bike Data</u> ⇒ webpage. However, while the data has been regularly updated, the team has yet to implement a

dashboard or sophisticated reporting process. City officials have questions about the

 You can load and continue working on the same workbook. **Files**

NOTE Note also that the data structure has changed over time, so it may be simpler for you to select data that uses the same columns across multiple files, preferably from

within the past year. **Instructions** Your task in this assignment is to aggregate the data found in the Citi Bike Trip History Logs and find two unexpected phenomena. 1. Design 2-5 visualizations for each discovered phenomenon (4-10 total). You may work with a timespan of your choosing. Optionally, you can also merge multiple datasets from different periods.

 The following are questions you may wish to answer. Do not limit yourself to these questions; they are suggestions for a starting point. Be creative! What are the peak hours when bikes are used during the summer months? What are the peak hours when bikes are used during the winter months?

changed?

Based on data, why?

is from).

and dashboards.

Considerations

Readability

Visual Appeal

Today, what are the bottom 10 stations in the city for ending a journey? What is the average distance in miles for a bike trip?

2. Use your visualizations (not necessarily all of them) to design a dashboard for each phenomenon. The dashboards should be accompanied by an analysis explaining why the phenomenon may be occurring.

Remember, the people reading your analysis will NOT be data analysts. Your audience colorful enough to be included in press releases, and your analysis should be thoughtful enough to inform programmatic changes. **Hints**

> change at some point in the history logs). • Consider building your visualizations with small extracts of the data (like single files) before attempting to import the whole thing. What you will find is that importing all 20+ million records of data will create performance issues quickly. Welcome to "Big Data." replacement decisions today? Probably not. Don't let overwhelming data fool you. Ground your analysis in common sense.

• Since this is a project for the city, spend the appropriate time thinking through decisions on color schemes, fonts, and visual storytelling. The Citi Bike program has a clear visual style. As a suggestion, look for ways to have your data visualizations match their aesthetic. • Pay attention to labels. What exactly is "time duration?" What's the value of "age of birth?" You will almost certainly need calculated fields to get what you need.

• Don't be afraid to manipulate your data and play with settings in Tableau. Tableau is meant to be explored. We haven't covered everything that you'll need-so keep an eye out for new tricks! • Treat this as a serious endeavor! This is an opportunity to show future employers
